## Brainstorm & Idea Prioritization Template

Brainstorming provides a collaborative environment that encourages the team to participate in creative problem solving, evaluating volume over value first, then categorizing and prioritizing feasible, high-impact technical solutions in ServiceNow.

### Step-1: Team Collaboration & Problem Selection

**Selected Problem:** Enforcing dynamic client-side governance, automated field population, and save-time validation on the ServiceNow Incident table to eliminate unassigned and improperly categorized high-impact incidents.

### Step-2: Brainstorm, Idea Listing & Grouping

| Cluster / Category                                    | Brainstormed Idea                                                                                                                                   | Mechanism in ServiceNow                                                                                                    |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>Cluster A: Declarative UI Rules</b>                | Make Assignment Group mandatory when Impact is High, and lock Urgency to read-only. Automatically revert fields when Impact is changed back.        | UI Policy on incident table with UI Policy Actions (Reverse if false = true).                                              |
| <b>Cluster B: Real-Time Dynamic Automation</b>        | When Impact is selected as High, immediately calculate and populate Urgency to High without waiting for record save, notifying user via top banner. | Client Script (onChange) on impact field using <code>g_form.setValue()</code> and <code>g_form.addInfoMessage()</code> .   |
| <b>Cluster C: Save-Time Data Integrity Guard</b>      | Intercept the submit action. If Impact is High and Assigned To is blank, block submission and highlight the missing field in red.                   | Client Script (onSubmit) using <code>g_form.showErrorBox()</code> and returning false.                                     |
| <b>Cluster D: List View Governance</b>                | Prevent users from changing incident State directly from list view to bypass lifecycle controls and mandatory fields.                               | Client Script (onCellEdit) on state field alerting user and returning <code>callback(false)</code> .                       |
| <b>Cluster E: Server-Side Enforcement (Discarded)</b> | Use Data Policies or before-Insert Business Rules to abort database transaction on server side.                                                     | <i>Evaluated but de-prioritized:</i> Server roundtrips cause poor UX latency compared to immediate client-side validation. |

### Step-3: Idea Prioritization Matrix (Value vs. Effort)

| Priority Quadrant                                  | Ideas Included                                                                                                                  | Implementation Rationale                                                                                                      |
|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>Quick Wins (High Impact, Low Effort)</b>        | 1. UI Policy for High Impact Control<br>2. UI Policy Action for Read-only Urgency<br>3. onChange Client Script for auto-urgency | Native declarative configuration and lightweight client-side scripts deliver instant user guidance with zero server overhead. |
| <b>Major Projects (High Impact, Medium Effort)</b> | 4. onSubmit Client Script save validation<br>5. onCellEdit Client Script list protection                                        | Guarantees 100% data integrity before database commit and closes governance loopholes in list views.                          |
| <b>Fill-ins (Low Impact, Low Effort)</b>           | Informational banner messages (addInfoMessage)                                                                                  | Enhances usability and confirms automation to the agent.                                                                      |
| <b>Thankless Tasks (Low Impact, High Effort)</b>   | Complex multi-step server Script Includes for basic UI checks                                                                   | Avoided because client scripts and UI policies solve the issue faster without unnecessary platform complexity.                |
