Customer Problem Statement Template

Create a problem statement to understand your customer's point of view. A well-articulated customer problem statement allows the team to find the ideal solution for challenges service desk personnel and incident managers face during critical incident logging.

Context: Incident records often require consistent and accurate data entry to ensure effective triage, routing, and resolution. Relying solely on user awareness and manual checks leads to incomplete, inconsistent, or unassigned high-impact incidents, leading to severe SLA breaches.

Problem Statement 1: Service Desk Analyst (Incident Creator)

Parameter	Details
Problem Statement (PS)	PS-1: Inaccurate Urgency & Missing Assignment on High Impact Incidents
I am (Customer)	An IT Service Desk Analyst / First-Line Support Engineer logging incoming enterprise outage tickets.
I’m trying to	Quickly submit critical, high-impact incidents into ServiceNow during high-stress operational disruption events.
But	I often forget to make Urgency high or fail to assign the incident to a specific owner, leaving it unassigned in the queue.
Because	The default incident form allows non-mandatory assignment fields on high-impact tickets and requires manual calculation between Impact and Urgency.
Which makes me feel	Stressed, anxious about violating Mean Time to Acknowledge (MTTA) and SLA penalties, and frustrated by manual administrative overhead.

Problem Statement 2: Incident Manager & Governance Lead

Parameter	Details
Problem Statement (PS)	PS-2: Unauthorized State Transitions via List Editing & Incomplete Data

I am (Customer)	An ITIL Incident Manager responsible for service reliability, MTTR reporting, and process compliance.
I'm trying to	Ensure strict adherence to the Incident lifecycle state machine and maintain accurate data for root-cause analysis.
But	Technicians bypass form validations and mandatory fields by updating incident State values directly in the list view.
Because	ServiceNow's native list editor allows inline modifications without triggering form-level client rules unless explicitly restricted.
Which makes me feel	Concerned about platform governance, audit vulnerabilities, unreliable management metrics, and premature incident closures.
