Maximum Marks	4 Marks		

Empathy Map Canvas: IT Support Specialist & Incident Creator

An empathy map is a collaborative visual tool used to articulate what we know about the end-user (ITIL Agent). It externalizes knowledge about users to create a shared understanding of user needs and guide design decisions.

1. What do they THINK and FEEL?

- **Worried:** "If I log this P1 incident incorrectly, the bridge call will be delayed."
- **Frustrated:** "Why doesn't the system auto-calculate Urgency when Impact is High?"
- **Cognitive Overload:** Navigating 40+ fields on the Incident form during critical outages.
- **Desires:** Intuitive, proactive field suggestions and real-time guardrails rather than post-submission rejections.

2. What do they SEE?

- The standard ServiceNow Incident form with multiple tabs and optional fields.
- Incident queues filling up with tickets lacking designated owners.
- Users complaining about tickets stuck in triage because Assignment Group was left blank.
- List views where anyone can double-click and alter ticket states without filling work notes.

3. What do they SAY and DO?

- **Says:** "I need ServiceNow to enforce mandatory fields automatically so tickets don't bounce."
- **Says:** "High impact incidents should immediately lock urgency to high without manual guesswork."
- **Does:** Selects Impact = 1 (High) and tries to hit Submit immediately to alert resolution teams.
- **Does:** Uses list view cell editing to perform quick updates across multiple incidents to save time.

4. What do they HEAR?

- Escalation managers demanding immediate ownership of High Impact tickets.
- SLA breach alerts sounding due to tickets sitting unassigned.
- Governance auditors warning about missing Assigned To data in historical records.
- Peers advising: "Be careful not to change ticket state in list view, it bypasses validations."

PAINS (Obstacles, Risks, Frustrations)

- Submitting tickets with missing Assigned To information, leading to unassigned critical outages.
- Manual overhead of remembering conditional business rules during high-pressure outages.
- Lack of real-time inline warnings before saving records.
- Audit penalties for unauthorized State changes done in list view.

GAINS (Needs, Goals, Measures of Success)

- Automated synchronization: Setting Impact to High automatically populates Urgency to High.
- Real-time field locking: Urgency becomes read-only so users cannot inadvertently downgrade it.
- Dynamic mandatory enforcement: Assignment Group becomes strictly mandatory on High Impact.
- Save prevention: onSubmit script stops incomplete submissions with clear, actionable error boxes.
- List edit protection: Guard against accidental or unauthorized state changes from list view.
