Maximum Marks	4 Marks		

Customer Journey Map: IT Service Desk Agent

The Customer Journey Map visualizes the step-by-step experience of an IT Service Desk Agent handling a critical business disruption. It illustrates user expectations, emotional states, touchpoints, system behaviors, and pain points before and after the implementation of Client Scripts and UI Policies.

Journey Stage	User Action	System Touchpoint	System Response / Behavior	User Emotional State	Pain Points & Opportunities
1. Incident Triage	Agent receives urgent notification that production payment gateway is down.	ServiceNow Portal / Alert Dashboard	Navigates to Incident → Create New. Default blank incident form loads.	Anxious / High Urgency	High pressure to log ticket accurately without delaying resolution teams.
2. Impact Selection	Agent sets Impact to 1 – High .	Incident Form (Impact Choice field)	UI Policy: Immediately marks <code>assignment_group</code> as mandatory. UI Action: Sets urgency to read-only. onChange Script: Auto-populates urgency to 1 – High and outputs informational banner.	Relieved / Supported	Eliminates cognitive burden and manual urgency calculation. Prevents accidental priority downgrades.
3. Incomplete Save Attempt	Agent fills short description but leaves <code>assigned_to</code> empty, then clicks Submit .	Incident Form (Submit / Save action)	onSubmit Script: Intercepts transaction, detects empty <code>assigned_to</code> on High Impact ticket, aborts save, and renders red error box directly beneath field.	Guided / Informed	Prevents orphaned critical incidents. Clear inline validation avoids generic confusing errors.

4. Correction & Record Creation	Agent selects senior on-call engineer in assigned_to and clicks Submit .	Incident Form (Submit action)	Validation passes, incident record is committed to database, SLA clock starts, on-call engineer alerted.	Satisfied / Confident	Incident triage completed cleanly in under 30 seconds with 100% data integrity.
5. Reversal Condition (De-escalation)	During diagnosis, impact is determined to be localized. Agent changes Impact to Medium .	Incident Form (Impact Choice field)	Reverse if false: assignment_group reverts to optional; urgency becomes editable again.	Empowered	Dynamic flexibility: agents are not locked into rigid rules once conditions change.
6. List View Interaction	Agent attempts to double-click and change incident State directly in the Incident List view.	Incident List View (Cell Edit)	onCellEdit Script: Triggers alert modal: <i>"State cannot be updated using list editing. Please open the Incident."</i> Cancels edit.	Disciplined	Guarantees that mandatory resolution notes and stage-gate workflows cannot be bypassed.
