Data Flow Diagrams & User Stories

This document details the graphical information flow across the ServiceNow Incident client subsystem and presents the Agile user stories governing implementation.

1. Data Flow Diagrams (DFD)

DFD Level 0: Context Level Diagram

DFD Level 1: Subsystem Process Decomposition

Process ID	Process Name	Input Data	Processing Logic	Output Data / Action
P1.0	Impact Change Listener	User changes impact dropdown to '1'	Evaluates UI Policy condition & triggers onChange script.	Sets urgency to '1', displays info banner, locks urgency read-only, sets assignment_group mandatory.

P2.0	Form Save Validation	User clicks Submit / Save	onSubmit checks if impact == '1' and assigned_to == ''.	If invalid: shows error box and aborts transaction (returns false). If valid: passes control to server.
P3.0	Condition Reversal Handler	User changes impact to '2' or '3'	UI Policy evaluates Reverse if false logic.	Reverts assignment_group to optional and restores urgency field editability.
P4.0	List Cell Edit Interceptor	User double-clicks state cell in list view	onCellEdit script intercepts modification event.	Alerts user to open form and returns callback(false) to cancel edit.

2. Agile User Stories

User Type	Epic	USN	User Story Description	Acceptance Criteria	Priority	Release
Service Desk Agent	High Impact UI Policy	USN-1	As a service desk agent, when I set Incident Impact to High, I want Assignment Group to become mandatory, so that critical incidents are never submitted without an owner team.	Given Impact is High, Assignment Group shows mandatory asterisk and blocks submission if blank.	High	Sprint-1
Service Desk Agent	Urgency Lock	USN-2	As a service desk agent, when Impact is High, I want Urgency to be locked to Read-only, so that ticket urgency cannot be inadvertently downgraded.	Given Impact is High, Urgency field is disabled/read-only on the form.	High	Sprint-1
Service Desk Agent	Urgency Automation	USN-3	As a service desk agent, when I select High Impact, I want Urgency to automatically update to High with a notification banner, so that priority calculation is instantaneous.	Changing Impact to High automatically populates Urgency to '1' and renders an informational message banner.	High	Sprint-2

Incident Manager	Save Validation	USN-4	As an Incident Manager, I want the system to prevent saving High Impact incidents if Assigned To is missing, so that every critical outage has a designated technician.	Attempting to save an incident with Impact=High and blank Assigned To shows a red error box and cancels save.	High	Sprint-2
Incident Manager	List Protection	USN-5	As an Incident Manager, I want to block State modifications from list views, so that technicians are forced to open the record and fulfill mandatory stage requirements.	Double-clicking State in list view prompts an alert modal and prevents cell modification.	Medium	Sprint-3
