

Solution Requirements (Functional & Non-functional)

Phase / Category	Requirement Analysis	Date	1/10/2026
Team ID	6ab9466dc23107aaaa73904b	Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	4 Marks		

Solution Requirements (Functional & Non-Functional)

This document specifies the technical and business requirements for the ServiceNow Incident Management client-side controls project.

1. Functional Requirements (FR)

FR No.	Epic / Functional Category	Sub-Requirement (Story / Specific Feature)	Target Field(s)	ServiceNow Mechanism
FR-1	High Impact UI Policy Enforcement	FR-1.1: Trigger policy when Incident Impact is set to '1 - High'. FR-1.2: Enforce Assignment Group as strictly mandatory. FR-1.3: Enable 'Reverse if false' to revert field constraints when Impact is downgraded.	impact assignment_group	UI Policy (High Impact Control) & UI Policy Action
FR-2	Urgency Field Access Control	FR-2.1: Lock Urgency field to Read-only upon High Impact condition. FR-2.2: Ensure Urgency remains visible to the user. FR-2.3: Revert Urgency to editable when Impact is non-high.	urgency	UI Policy Action linked to High Impact Control
FR-3	Real-Time Urgency Automation	FR-3.1: Execute immediately when Impact field value changes. FR-3.2: Automatically set Urgency to '1 - High' when Impact is '1'. FR-3.3: Display visual info banner notifying agent of auto-assignment.	impact → urgency	Client Script: onChange (Auto set urgency for high impact)

FR-4	Save-Time Form Validation	FR-4.1: Intercept form save/submit event. FR-4.2: Verify whether Impact is '1' and Assigned To is empty. FR-4.3: Prevent record save if condition matches. FR-4.4: Display field-level red error box under Assigned To.	assigned_to	Client Script: onSubmit (Prevent save if Assigned To missing)
FR-5	List View Governance	FR-5.1: Detect cell-editing attempts on State field in list view. FR-5.2: Display browser alert explaining list editing is restricted. FR-5.3: Abort cell update via callback(false).	state	Client Script: onCellEdit (Prevent state change via list edit)

2. Non-Functional Requirements (NFR)

NFR No.	Non-Functional Requirement	Detailed Specification
NFR-1	Usability	User feedback must be immediate and contextual. Field-level errors must use native showErrorBox and notifications must use addInfoMessage without intrusive modal dialogs on forms.
NFR-2	Performance & Latency	All client logic must execute purely on the client-side DOM in under 50ms, requiring zero synchronous GlideRecord server roundtrips.
NFR-3	Data Reliability	100% elimination of unassigned High Impact incidents. Rules must dynamically adapt if users change values multiple times prior to submission.
NFR-4	Security & Governance	Closes list-editing loopholes so lifecycle workflows (e.g., Incident State progression) cannot be bypassed outside authorized forms.
NFR-5	Maintainability & Upgradability	Follows ServiceNow best practices by utilizing declarative UI Policies for simple visibility/mandatory rules and standard modular JavaScript for scripting.
NFR-6	Cross-Browser Compatibility	Consistent behavior across Google Chrome, Microsoft Edge, Mozilla Firefox, and ServiceNow Service Operations Workspace.
