Solution Architecture

Solution architecture describes the technical layers, data models, client event pipelines, and subsystem integrations required to realize business governance on the ServiceNow platform.

1. Architectural Flow & Execution Order

ServiceNow executes client-side logic in a strict deterministic order. The diagram below illustrates how client interactions propagate through the event lifecycle:

2. Architecture Implementation Artefacts

The solution is constructed entirely from native ServiceNow platform configuration objects stored in system metadata tables:

Artifact Type	Table Name	Record Identifier / Name	Role in Solution Architecture
UI Policy	sys_ui_policy	High Impact Control	Declarative condition evaluator monitoring impact == 1. Controls field states.
UI Policy Action	sys_ui_policy_action	Action on assignment_group	Enforces mandatory state dynamically.
UI Policy Action	sys_ui_policy_action	Action on urgency	Enforces read-only state dynamically.
Client Script (onChange)	sys_script_client	Auto set urgency for high impact	Synchronizes urgency field value and alerts user when impact changes.
Client Script (onSubmit)	sys_script_client	Prevent save if Assigned To missing	Pre-submission validation gatekeeper preventing orphaned critical records.
Client Script (onCellEdit)	sys_script_client	Prevent state change via list edit	List-view security boundary enforcing standard incident lifecycle stages.

3. Configuration Architecture & Visual Verification

Below are configuration records captured from the ServiceNow developer instance during implementation:
